

Services

ctrlaltcrew — Detailed Service Catalog

This catalog describes every service ctrlaltcrew offers. Each entry lists what the service includes, who it is suitable for, example project types, and important limitations to set realistic expectations.

1. Web Application Development

Design and development of custom websites and web applications, ranging from simple marketing sites to full business web applications with user accounts and admin panels.

What's Included

- Responsive front-end design for desktop and mobile browsers
- Content management or custom admin interface where needed
- Basic on-page SEO setup (titles, meta descriptions, sitemaps)
- Contact/lead forms and analytics integration
- Hosting and deployment setup guidance

Typical Use Cases

- Company or product marketing websites
- Internal business tools and dashboards
- Customer or member portals
- Booking and scheduling systems

Suitable Client/Business Types

- Small and medium businesses
- Startups
- Service-based businesses
- Educational organizations

Example Project Types

- Company website with a blog
- Client portal with login
- Internal reporting dashboard
- Booking/reservation web app

Important Limitations or Considerations

- Highly complex, large-scale enterprise platforms may require a longer engagement than the standard timelines listed in the pricing document.
- Ongoing content updates after launch are typically handled by the client unless a support plan that includes content updates is purchased.

2. Mobile App Development

Development of mobile applications for iOS, Android, or both, using either native development or a cross-platform framework depending on project needs and budget.

What's Included

- UI design adapted for mobile screens and interaction patterns
- Core app functionality connected to a backend/API
- Push notification setup where required
- App store listing preparation guidance

Typical Use Cases

- Consumer-facing apps (booking, ordering, community, content)
- Internal staff or field-operations apps
- Companion apps for an existing web product

Suitable Client/Business Types

- Startups
- E-commerce businesses
- Service-based businesses
- Businesses with field staff needing a mobile tool

Example Project Types

- Food ordering app
- Fitness/booking app
- Internal delivery-tracking app
- Companion app for a web platform

Important Limitations or Considerations

- Native development (separate iOS and Android codebases) generally costs more and takes longer than a cross-platform build; the appropriate approach depends on project requirements.
- App store review timelines (Apple App Store, Google Play) are outside ctrlaltcrew's control and can add days to launch.
- Ongoing app store account fees are the client's responsibility.

3. E-Commerce Development

Development of online stores, including product catalogs, shopping cart and checkout flows, payment gateway integration, and order/inventory management.

What's Included

- Product catalog with categories, variants, and search/filtering
- Shopping cart and checkout flow
- Payment gateway integration (e.g., Stripe or a regionally appropriate provider)

- Order management and basic inventory tracking
- Admin panel for managing products and orders

Typical Use Cases

- New online storefronts
- Migrating an existing store to a new platform
- Adding e-commerce functionality to an existing website

Suitable Client/Business Types

- Retail businesses
- Consumer product brands
- Service businesses selling add-on products

Example Project Types

- Direct-to-consumer online store
- Multi-vendor marketplace (extended scope)
- Store migration project

Important Limitations or Considerations

- Multi-vendor marketplaces, subscription billing, and complex tax/shipping rules increase scope beyond a standard storefront and are estimated separately.
- Payment gateway approval and compliance (e.g., PCI considerations) depend on the client's chosen payment provider and business registration.

4. Backend & API Development

Design and development of server-side systems: databases, business logic, authentication, and REST or GraphQL APIs that power web apps, mobile apps, or integrations with other systems.

What's Included

- Database design and schema modeling
- REST or GraphQL API development
- Authentication and authorization (e.g., user accounts, role-based access)
- Integration with third-party APIs and services
- API documentation

Typical Use Cases

- Backend for a new web or mobile application
- Standalone API to connect existing systems
- Migrating or modernizing a legacy backend

Suitable Client/Business Types

- Startups building a product
- Businesses connecting multiple internal systems

- Teams needing a data layer for a new app

Example Project Types

- REST API for a mobile app
- Internal API connecting a CRM and a website
- Authentication service for multiple apps

Important Limitations or Considerations

- Performance and scalability requirements (expected traffic/load) should be discussed during requirement gathering, since they affect architecture choices and cost.
- Ongoing infrastructure/hosting costs are separate from development cost and are typically billed directly by the cloud provider to the client.

5. AI Chatbots & Virtual Assistants

LLM-powered conversational assistants that can answer questions, guide users, qualify leads, or provide customer support on a website, WhatsApp, or another messaging channel.

What's Included

- Conversation design for the assistant's intended purpose
- LLM integration with prompt design and guardrails
- Deployment on a website widget, WhatsApp, or similar channel
- Basic analytics on conversation volume and common questions

Typical Use Cases

- Customer support and FAQ answering
- Lead qualification and capture on a website
- Guided product recommendations

Suitable Client/Business Types

- Businesses with high volumes of repetitive customer questions
- E-commerce businesses
- Service businesses that want 24/7 first-line response

Example Project Types

- Website support chatbot
- WhatsApp order-status assistant
- Lead-capture chatbot for a landing page

Important Limitations or Considerations

- A chatbot answering questions from company-specific content requires a RAG pipeline (see the RAG-Based Knowledge Assistants service) rather than the LLM's general knowledge alone.
- Chatbots that handle sensitive actions (payments, account changes) require additional security review, which is scoped separately.

6. RAG-Based Knowledge Assistants

Retrieval-Augmented Generation (RAG) systems that let an AI assistant answer questions using a client's own documents, FAQs, product data, or internal knowledge base, rather than relying only on the underlying language model's general knowledge.

What's Included

- Document ingestion and preprocessing (PDFs, docs, web pages, spreadsheets, etc.)
- Chunking and embedding generation for the provided content
- Vector database setup and retrieval pipeline
- Chatbot or search-style interface connected to the retrieval pipeline
- Source-citation behavior so answers reference the underlying documents

Typical Use Cases

- Internal employee knowledge-base assistants
- Customer-facing product/document Q&A
- Support-ticket deflection using existing help-center content

Suitable Client/Business Types

- Businesses with substantial existing documentation
- Support teams handling repetitive questions
- Product companies with technical documentation

Example Project Types

- Internal HR/policy assistant
- Customer-facing product-manual Q&A bot
- Legal or compliance document search assistant

Important Limitations or Considerations

- Answer quality depends directly on the quality, organization, and completeness of the source documents provided by the client.
- The assistant is designed to answer from provided content; it will not reliably answer questions outside the scope of the ingested documents unless general-knowledge fallback is explicitly requested and scoped.
- Keeping the knowledge base current after launch requires periodic re-ingestion of updated documents (see the Support and Maintenance document).

7. Agentic AI & Workflow Automation

AI systems that go beyond answering questions to actually performing multi-step tasks — using tools, calling APIs, and taking actions across one or more systems to complete a workflow with minimal human intervention.

What's Included

- Workflow analysis to identify automatable steps
- Agent design with defined tools/actions the AI is permitted to take
- Integration with the systems the agent needs to act on (e.g., email, CRM, spreadsheets, internal APIs)
- Safeguards such as human-in-the-loop approval steps for sensitive actions

Typical Use Cases

- Automating multi-step data entry or report generation
- AI-assisted triage that routes and drafts responses to incoming requests
- Agents that pull data from multiple systems to complete a task

Suitable Client/Business Types

- Operations-heavy businesses
- Teams with repetitive, rule-based multi-step processes
- Businesses looking to reduce manual back-office work

Example Project Types

- Automated lead-routing and CRM update agent
- Report-generation agent pulling from multiple data sources
- Document-processing and data-entry agent

Important Limitations or Considerations

- Agentic systems that take real-world actions (e.g., sending emails, updating records) require careful scoping and testing to avoid unintended actions.
- This is generally the most complex AI service category and is scoped on a project-by-project basis; see the Project Packages document for indicative ranges.

8. UI/UX Design

Interface and experience design that supports web, mobile, e-commerce, and AI-assistant projects, ensuring the product is usable and consistent with the client's brand.

What's Included

- Wireframes and information architecture
- Visual UI design consistent with brand guidelines (or a new lightweight brand direction if none exists)
- Interactive prototypes for client review before development begins
- Design handoff assets for the development team

Typical Use Cases

- New product design from scratch
- Redesign of an existing outdated interface
- Design for a chatbot or AI-assistant interface

Suitable Client/Business Types

- Startups without an existing design system

- Businesses redesigning an outdated product
- Any client wanting a custom (non-template) look

Example Project Types

- App UI design and prototype
- Website redesign
- Design system for a multi-product suite

Important Limitations or Considerations

- UI/UX design is typically bundled into web, mobile, and e-commerce packages at a standard level; a fully custom design system with original branding is a larger scope and is estimated separately.
